

## CHAPTER – VI

### PROJECT DEVELOPMENT

#### 6.1 – Pre-Requisites

To work with housing market data we need to have a things in place. We need to be able to collect, process, analyze and visualize housing market data. The first thing we need is a dataset about the housing market. This dataset should have information like sale prices how big the properties the number of bedrooms and bathrooms where the properties are, when they were built how big the lots are and when the properties were sold. We need to make sure this dataset is complete, accurate and comes from sources like real estate databases government records or public housing datasets.

We also need a way to store and manage our data. We should keep our data in organized formats like CSV, Excel or databases so we can easily get to it and analyze it. This helps us keep our data safe and makes it easier to work with. We need to have Tableau Desktop or Tableau Public which we will just call Tableau to make dashboards, charts, maps and reports that people can interact with. We should know the basics of how Tableau works, like how to connect to data make worksheets and design dashboards. Another important thing is being able to get our data ready and clean. We need to know how to deal with missing information remove data fix inconsistencies and change our data into the right format. Knowing how to use spreadsheet tools, SQL or Tableau Prep can really help us get our data ready. We also need to know some analytics and statistics. We should understand things like averages how data is spread out how things are related, trends and key performance indicators or KPIs for the housing market. This helps us understand what is going on in the housing market and get information from our data. We need to have the computer and software to work on our project. This means having a computer that's powerful enough has enough memory, a modern operating system and the right software, like Microsoft Excel, database management systems and a way to connect to the internet so we can get data and share our dashboards.

## Visualizing housing market trends: an analysis of sale prices and features using tableau

---

We also need to make sure everyone working on the project knows what we are trying to do what we hope to get out of it and what the business needs are. We should plan everything out decide who will do what and set up communication before we start working.

We will be working with housing market data throughout this project so it is essential to have all these things in place to work with housing market data effectively.
