

9.2 – Disadvantages

- Disadvantages of Visualizing Housing Market Trends
- Analysis of Housing Sale Prices and Property Features
- The accuracy of housing market visualizations depends on data quality.
- The software used for visualization mainly shows what happened in the past. Helps explore
- For predicting market trends other tools are needed.
- Housing data often needs a lot of cleaning up and rearranging before it can be visualized.
- Getting the data ready can take a lot of time and resources.
- Performance Issues with Large Datasets Big housing market datasets can make dashboards
- Risk of Misinterpretation If charts are not made properly users might draw conclusions.
- Requires Expertise Making dashboards and calculations needs technical knowledge.
- The software used for visualization costs money. Has licensing fees.
- For organizations that need users and servers the costs can add up.
- Getting real-time updates can require extra setup and resources.
- How often data is refreshed can affect how accurate the dashboard is. Sharing dashboards can expose information about properties or finances.
- Proper controls must be put in place to protect the data.
- Putting many charts, filters and key performance indicators on dashboards can make them confusing.
- Users might struggle to find key insights.
- Analysis is often based on housing sales and market trends.
- Sudden changes in the market might not be shown away
- Dashboards need updates as new housing data comes in.
- Changes in data sources might require redesigning visualizations.

Visualizing Housing Market Trends: An Analysis of Housing Sale Prices and Property Features Using Tableau

- Visualizations might not capture factors like government policies, economic conditions or interest rate changes.
- Extra analysis is often needed for decision-making.
